POST TREATMENT INSTRUCTIONS FILLINGS

Following the placement of a filling it is not uncommon for several days to several weeks to experience temperature sensitivity and a slight taste. If you experience tenderness to chewing your bite might need to be adjusted. The filling may not harden completely for up to 24 hours, so please try and chew on the opposite side. For that same period hard candies, nuts and sticky food should be avoided until the filling hardens.

Any other discomfort should go away after a few days. If not please contact this office as you may need a minor adjustment to the filling material.

If the Doctor has given you a prescription, please get it filled as soon as possible. If you are given Antibiotics please insure you take all that have been prescribed as it is necessary to control any infection. Antibiotics may effect birth control medications. Please consult your pharmacist for further drug information and interaction.
